ARINC vMUSE™ mobile

Eliminate queues and give passengers more free time

As more and more people use air travel, airport check-in counters are increasingly crowded. Lines form, passengers are unhappy and airport operations are affected. Rockwell Collins now offers the ideal solution to reduce queues and keep passengers moving – ARINC vMUSE™ mobile.

Secure, reliable and efficient

Featuring the same security and reliability of our trusted, IATA-compliant ARINC common-use passenger processing (CUPPS) system, ARINC vMUSE mobile provides a seamless user experience that optimizes operations, reduces costs and creates revenue opportunities.

Easy, fast and flexible

With ARINC vMUSE mobile there is no installation time, software configuration, telecommunications lines, or added technical resources necessary. The system features a tablet PC and peripherals housed in a secure protective casing so that you can launch passenger check in service in minutes, wherever there is an internet connection – even over WiFi and 3G. Perfect for airports, airlines and ground handlers, it's also great for irregular and overflow operations, parking terminals, rental car facilities, transit stations, and other venues where common-use isn't established.

Innovative passenger processing options

Flexible and cost-effective, ARINC vMUSE mobile opens up a number of unique passenger processing opportunities for airlines and airports that include off-airport check-in, processing for start-up operations, dealing with irregular operational situations, and onboard passenger processing. ARINC vMUSE mobile is the perfect tool to provide value-added service for VIPs, frequent flyers or premium passengers.
